

WordTricks Centralized Template Management

Overview

With WordTricks, administrators are able to centrally manage all Word templates by placing templates in a shared WordTricks template directory. Administrators have the ability to add or remove templates from the workstations by simply placing templates in the add or remove network template directory from one location.

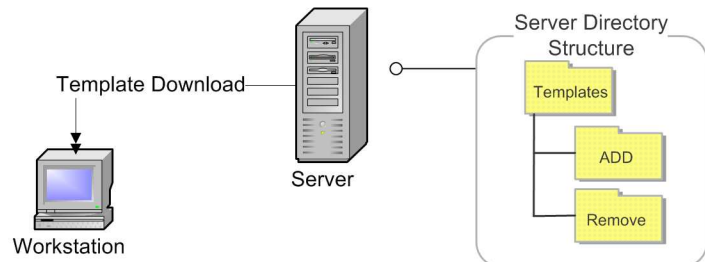

The WordTricks workstation update downloads the network templates to the workstations effortlessly. Each time a user logs in WordTricks adds any modified or new templates and removes any deleted templates. WordTricks then loads your Firm.dot which loads any other third party applications, such as your document management system, Adobe, and DeltaView just to name a few.

User Login

Step 1

WordTricks Update

WTX_Update.exe downloads and/or removes any template residing in the WordTricks network template directory.

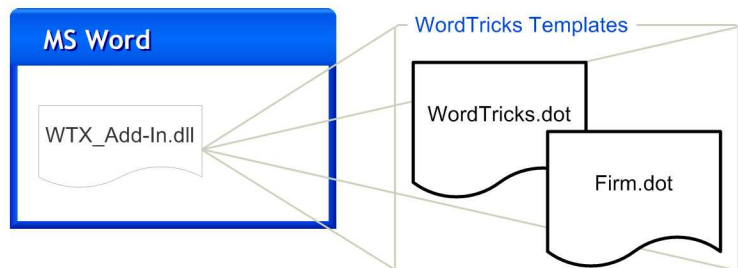

Word Initialization

Step 2

Word Plug-In

WTX_Add-In.dll loads WordTricks.dot and Firm.dot on Word startup.

Step 3

Word Add-Ins

Firm.dot can be modified to load third party add-ins such as Adobe, DeltaView, a document management system, or any other Word third party add-in.
